Node.js and Express Setup Description:

For the backend development of Aking Kaganapan, I used Node.js to run the JavaScript code and Express.js to create the server and API routes. I also used Mongoose to connect the application to MongoDB and dotenv to manage the environment variables. The backend files are organized into folders for routes, controllers, models, and database configuration. This setup helps organize the code and makes it easier to manage user accounts and event bookings.

List of defined API endpoints:

HTTP Method	API Endpoint	Description
GET	/	Displays the welcome message of the Aking Kaganapan API.
GET	/api/test	Checks if the API server is working properly.
GET	/api/bookings	Retrieves all booking records, sorted from newest to oldest.
POST	/api/bookings	Creates and saves a new booking record in the database.
GET	/api/bookings/:id	Retrieves a specific booking using its ID.
PUT	/api/bookings/:id	Updates an existing booking using its ID.
DELETE	/api/bookings/:id	Deletes a booking record using its ID.
POST	/api/users/register	Register a new user account.
POST	/api/users/login	Processes a user's login request.
